

Introduction to Cybersecurity (CYBERSEC)

Module 1: What is Cybersecurity?

Assets, Risk and Attackers

Lesson Notes

KMVTECHUG

Version: 2026

Assets and Risk

An asset is anything valuable: accounts, files, devices, reputation. Risk is the chance that a threat will harm an asset.

Reduce the most likely and most damaging risks first.

Who Attacks and Why

Attackers may seek money, data, disruption, or access to other people through you. Many attacks are opportunistic.

Personal vs Organisational

Personal security is your devices and accounts. Organisational security adds policies and shared systems.

Reflect: List three digital assets you use this week and one risk for each.

Closing

Module 2 covers malware, phishing, and student-targeted scams.
