

Cognitive Psychology (COGPSY)

Module 6: Moral Cognition, AI and the Future

Moral Reasoning and Student Ethics

Lesson Notes

KMVTECHUG

Version: 2026

Moral Reasoning

Moral reasoning is thinking about what is right or wrong and why. It is not only emotion. People give reasons, weigh harm and fairness, and consider rules and relationships. Psychology students meet moral questions in research ethics, counselling boundaries, and community work.

Moral Awareness and Competence

Moral awareness is noticing that a situation has ethical weight. Moral competence is the ability to reason and act appropriately once you notice it. Noticing that a classmate's private story should not be shared in a group chat is awareness. Choosing not to share it is competence in action.

Ethics in Student Life

Academic honesty in coursework and exams, respect for confidentiality in practice placements, fair treatment of peers in group work, and careful use of other people's data or stories are everyday ethical tests for students.

Reflect: Which student ethics issue feels most relevant to your current programme?

Closing

The final lesson looks at AI and the future of cognitive psychology.
