

Cognitive Psychology (COGPSY)

Module 6: Moral Cognition, AI and the Future

AI and the Future of the Field

Lesson Notes

KMVTECHUG

Version: 2026

Cognitive Psychology and AI

Artificial intelligence systems process information, recognise patterns, and produce language. That invites comparison with human cognition. Humans still differ in consciousness, lived experience, and moral responsibility. AI can support learning with practice questions and summaries, but it does not replace the need to understand.

For psychology students in Uganda, the practical question is how to use AI tools without shortcutting real learning.

The Future of the Field

Cognitive psychology continues to connect with neuroscience, education, health, and technology. Future practitioners will need clear thinking about evidence, ethics, and human limits. Your foundation from this course, attention, memory, thinking, motivation, perception, and moral awareness, remains useful across those paths.

Course Wrap-Up

You have moved from the definition of cognitive psychology through learning and memory to thinking, motivation, perception, moral reasoning, and AI. Use the habits: encode with meaning, test yourself, manage stress, and notice ethical issues early.

Reflect: *How will you use one idea from this course in your next month of study?*

Closing

Module 6 completes Cognitive Psychology. Pass the graded quizzes and check your dashboard for certificate status.
