

Introduction to Artificial Intelligence (INTRAI)

Module 5: AI in Uganda and Africa

Local Use Cases

Lesson Notes

KMVTECHUG

Version: 2026

Local Use Cases

Across East Africa, teams apply AI to agriculture, health triage support, financial risk, language tools, and public information services.

Scale varies: some projects are pilots; some are embedded in products people already use.

Agriculture, Health and Finance

Agriculture: image-based disease hints, advisory messages, weather-informed suggestions.

Health: decision support for screening, with clinicians still responsible.

Finance: fraud signals, credit scoring experiments, customer service automation.

Benefits appear when data is relevant and humans stay in the loop for high-stakes choices.

Education and Public Services

Universities and training hubs in Uganda are expanding AI-related teaching and research capacity. Students who understand basics can participate more effectively.

Public services explore chat interfaces and analytics. Success still depends on trust, connectivity, and inclusive design.

Reflect: Which local sector (agriculture, health, finance, or education) feels most relevant to your future work, and why?

Closing

Next lesson: opportunities, gaps, and building local capacity.
